All questions answered in 1-6 format with output. Due to the length of output for residuals, leverage, cooks distance, and covariance the results were not included in word. However, the formulas were. Please run in rstudio to see results or view pdf for entire results.

1. Cleaning Datapoints based off the information and the given datapoints we would clean: City Name, Property Type. These have information that is not full, and not relevant.

Creating Variables: Sale date picked as another predictor because it allows for comparison based on time

Including Plots

2. Rsquared represents the correlation between the dependent variable and the independent variable. In this case it shows for the sale_lm an rsquared of .01435 and the rsquared for the model saleonbed_lm .06278. The addition of the sale year helped improve the rsquared. Showing a better correlation based off that, but rsquare is still very low for us to determine impact between the variables.

3. #The beta coefficients in for these datapoints shows a positive relationship.This tells us that as the independent variable increases so does the dependent.These betas are not very strong, as shown in the results. But, they are positive in result.

6. Based off the information above I believe the data is not biased. Though one of the key factors we can look at is multicollinearity and it is above 1. It is not above it substantially enough to show significant impact on the data.
